TYPES

Types for Proofs and Programs

Coordination Action FP6-2002-IST-C

Deliverable: Short Course

Monads and more

Intensive course by <u>Tarmo Uustalu</u>, Institute of Cybernetics, Tallinn, Estonia. Intended audience: Postgraduates and researchers in Theoretical Computer Science.

Slides:

- Monday (upupdated)
- Tuesday (update)
- <u>Wednesday</u>
- <u>Friday</u> <u>Slides about tree transducers</u>

Course contents:

- 1. Monads and why they matter for a working programming language person
- 2. Combining monads: monad transformers, distributive laws, the coproduct of monads
- 3. Finer and coarser: Lawvere theories and arrows
- 4. Comonads and context-dependent computation
- 5. Notions of computation on trees

Time and place

Monday 14 May - Wednesday + Friday, 9:00-11:00 in C60 (may change), CS & IT.

Contact

Thorsten Altenkirch

Last modified: Thu May 24 10:06:18 BST 2007

Monads and More: Part 1

Tarmo Uustalu, Institute of Cybernetics, Tallinn

University of Nottingham, 14–18 May 2007 University of Udine, 2–6 July 2007

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Outline

- Monads and why they matter for a working functional programmer: monads, Kleisli categories, monadic computation, strong and commutative monads, monadic semantics
- Combining monads: monads from adjunctions, distributive laws, the coproduct of monads
- Finer and coarser: Lawvere theories, arrows and Freyd categories
- Comonadic notions of computation: comonads and coKleisli categories, comonadic computation, in particular dataflow computation, lax/strong symmetric monoidal comonads, comonadic semantics
- Notions of computation on trees

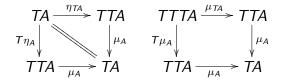

Prerequisites

- Basics of functional programming and typed lambda calculi
- From category theory:
 - functors, natural transformations
 - adjunctions
 - symmetric monoidal (closed) categories
 - Cartesian (closed) categories, coproducts
 - initial algebra, final coalgebra of a functor

Monads

- \bullet A monad on a category ${\mathcal C}$ is given by a
 - a functor $T : C \to C$ (the underlying functor),
 - a natural transformation $\eta : \mathsf{Id}_{\mathcal{C}} \xrightarrow{\cdot} T$ (the *unit*),
 - a natural transformation $\mu : TT \rightarrow T$ (the *multiplication*)

satisfying these conditions:

 This definition says that (T, η, μ) is a monoid in the endofunctor category [C, C].

An alternative formulation: Kleisli triples

- A more combinatory formulation is the following.
- A monad (Kleisli triple) is given by
 - an object mapping $T: |\mathcal{C}| \to |\mathcal{C}|$,
 - for any object A, a map $\eta_A: A \to TA$,
 - for any map $k : A \rightarrow TB$, a map $k^* : TA \rightarrow TB$ (the *Kleisli extension* operation)

satisfying these conditions:

- if $k : A \to TB$, then $k^* \circ \eta_A = k$,
- $\bullet \ \eta^\star_A = \operatorname{id}_{\mathit{T\!A}},$
- if $k : A \to TB$, $\ell : B \to TC$, then $(\ell^* \circ k)^* = \ell^* \circ k^*$.

• (Notice there are no explicit functoriality and naturality conditions.)

Monads vs. Kleisli triples

- There is a bijection between monads and Kleisli triples.
- Given T, η , μ , one defines

• if $k : A \to TB$, then $k^* =_{df} TA \xrightarrow{Tk} TTB \xrightarrow{\mu_B} TB$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

• Given T (on objects only), η and $-^*$, one defines

• if
$$f : A \to B$$
, then
 $Tf =_{df} (A \xrightarrow{f} B \xrightarrow{\eta_B} TB)^* : TA \to TB$,
• $\mu_A =_{df} (TA \xrightarrow{id_{TA}} TA)^* : TTA \to TA$.

Kleisli category of a monad

- A monad T on a category C induces a category KI(T) called the Kleisli category of T defined by
 - $\bullet\,$ an object is an object of $\mathcal{C},$
 - a map of from A to B is a map of C from A to TB,
 - $\operatorname{id}_{A}^{T} =_{\operatorname{df}} A \xrightarrow{\eta_{A}} TA$, • $\operatorname{if} k : A \to^{T} B, \ell : B \to^{T} C$, then $\ell \circ^{T} k =_{\operatorname{df}} A \xrightarrow{k} TB \xrightarrow{T\ell} TTC \xrightarrow{\mu_{C}} TC$
- From C there is an identity-on-objects inclusion functor J to KI(T), defined on maps by

• if
$$f : A \to B$$
, then
 $Jf =_{df} A \xrightarrow{f} B \xrightarrow{\eta_B} TB = A \xrightarrow{\eta_A} TA \xrightarrow{Tf} TB$.

Computational interpretation

- Think of C as the category of pure functions and of TA as the type of effectful computations of values of a type A.
- KI(T) is then the category of effectful functions.
- $\eta_A : A \to TA$ is the identity function on A viewed as trivially effectful.
- Jf : A → TB is a general pure function f : A → B viewed as trivially effectful.
- μ_A : $TTA \rightarrow TA$ flattens an effectful computation of an effectful computation.

・ロト ・ 日 ・ モ ト ・ モ ・ うへぐ

k^{*}: TA → TB is an effectful function k : A → TB extended into one that can input an effectful computation.

Examples

- Exceptions monad:
 - $TA =_{df} A + E$ where E is some object (of exceptions),
 - $\eta_A =_{\mathrm{df}} A \xrightarrow{\mathrm{inl}} A + E$,
 - $\mu_A =_{\mathrm{df}} (A + E) + E \xrightarrow{[\mathrm{id}, \mathrm{inr}]} A + E$,
 - if $k : A \to B + E$, then $k^* =_{df} A + E \xrightarrow{[k,inr]} B + E$.
- Output monad:
 - TA =_{df} A × E where (E, e, m) is some monoid (of output traces), e.g., the type of lists of a fixed element type with nil and append,
 - $\eta_A =_{\mathrm{df}} A \xrightarrow{\mathrm{ur}} A \times 1 \xrightarrow{\mathrm{id} \times e} A \times E$,
 - $\mu_A =_{\mathrm{df}} (A \times E) \times E \xrightarrow{\mathsf{a}} A \times (E \times E) \xrightarrow{\mathsf{id} \times m} A \times E$,
 - if $k : A \to B \times E$, then $k^* =_{df} A \times E \xrightarrow{k \times id} (B \times E) \times E \xrightarrow{a} B \times (E \times E) \xrightarrow{id \times m} B \times E.$

- Reader monad:
 - TA =_{df} E ⇒ A where E is some object (of environments),
 - $\eta_A =_{df} \Lambda(A \times E \xrightarrow{fst} A),$ • $\mu_A =_{df} \Lambda((E \Rightarrow (E \Rightarrow A)) \times E \xrightarrow{\langle ev, snd \rangle} (E \Rightarrow A) \times E \xrightarrow{\langle ev, snd \rangle} (E \Rightarrow A) \times E \xrightarrow{ev} A),$ • if $k : A \to E \Rightarrow B$, then $k^* =_{df} \Lambda((E \Rightarrow A) \times E \xrightarrow{\langle ev, snd \rangle} A \times E \xrightarrow{k \times id} (E \Rightarrow B) \times E \xrightarrow{ev} B).$

• Side-effect monad:

•
$$TA =_{df} S \Rightarrow A \times S$$
 where S is some object (of states),
• $\eta_A =_{df} \Lambda(A \times S \xrightarrow{id} A \times S)$,
• $\mu_A =_{df} \Lambda(S \Rightarrow ((S \Rightarrow A \times S) \times S) \times S) \xrightarrow{ev} (S \Rightarrow A \times S) \times S \xrightarrow{ev} (A \times S)$,
• if $k : A \to S \Rightarrow B \times S$, then $k^* =_{df} \Lambda((S \Rightarrow A \times S) \times S) \xrightarrow{ev} A \times S \xrightarrow{k \times id} (S \Rightarrow B \times S) \times S \xrightarrow{ev} B \times S)$.

• Continuations monad:

TA =_{df} (A ⇒ R) ⇒ R where R is some object (of answers),

•
$$\eta_A =_{\mathrm{df}} \Lambda(A \times (A \Rightarrow R) \xrightarrow{\mathsf{c}} (A \Rightarrow R) \times R \xrightarrow{ev} R),$$

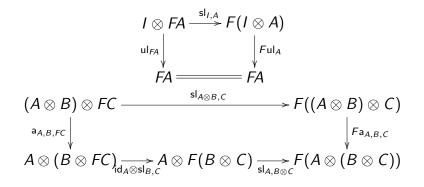

• if
$$k : A \to (B \Rightarrow R) \Rightarrow R$$
, then
 $k^* =_{\mathrm{df}} \Lambda(((A \Rightarrow R) \Rightarrow R) \times (B \Rightarrow R))$
 $\stackrel{\mathrm{id} \times \Lambda(\Lambda^{-1}(k) \circ c)}{\longrightarrow} ((A \Rightarrow R) \Rightarrow R) \times (A \Rightarrow R) \xrightarrow{\mathrm{ev}} R).$

Strong functors

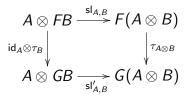

• A strong functor on a category $(\mathcal{C}, I, \otimes)$ is given by

- an endofunctor F on C,
- together with a natural transformation

 $sl_{A,B}: A \otimes FB \rightarrow F(A \otimes B)$ (the *(tensorial) strength*) satisfying

 A strong natural transformation between two strong functors (F, sl), (G, sl') is a natural transformation *τ* : F → G satisfying

・ロト・日本・日本・日本・日本・今日・

Strong monads

A strong monad on a monoidal category (C, I, ⊗) is a monad (T, η, μ) together with a strength sl for T for which η and μ are strong, i.e., satisfy

(Note that Id is always strong and, if F, G are strong, then GF is strong.)

Commutative monads

If (C, I, ⊗) is symmetric monoidal, then a strong functor (F, sl) is actually bistrong: it has a *costrength* sr_{A,B} : FA ⊗ B → F(A ⊗ B) with properties symmetric to those of a strength defined by

$$\mathsf{sr}_{A,B} =_{\mathrm{df}} \mathsf{FA} \otimes B \xrightarrow{\mathsf{c}_{\mathsf{FA},B}} B \otimes \mathsf{FA} \xrightarrow{\mathsf{sl}_{B,A}} \mathsf{F}(B \otimes A) \xrightarrow{\mathsf{Fc}_{B,A}} \mathsf{F}(A \otimes B)$$

• A bistrong monad (*T*, sl, sr) is called *commutative*, if it satisfies

Examples

- Exceptions monad:
 - $TA =_{df} A + E$ where E is an object,
 - $\mathsf{sl}_{A,B} =_{\mathrm{df}} A \times (B+E) \xrightarrow{\mathrm{dr}} A \times B + A \times E \xrightarrow{\mathrm{id}+\mathsf{snd}} A \times B + E.$
- Output monad:
 - $TA =_{df} A \times E$ where (E, e, m) is a monoid,
 - $\mathsf{sl}_{A,B} =_{\mathrm{df}} A \times (B \times E) \xrightarrow{\mathsf{a}^{-1}} (A \times B) \times E.$
- Reader monad:
 - $TA =_{df} E \Rightarrow A$ where E is an object,
 - $\mathsf{sl}_{A,B} =_{\mathrm{df}} \Lambda((A \times (E \Rightarrow B)) \times E)$ $\xrightarrow{a} A \times ((E \Rightarrow B) \times E) \xrightarrow{\mathsf{id} \times \mathsf{ev}} A \times B).$

Tensorial vs. functorial strength

- A functorially strong functor on a monoidal closed category (C, I, ⊗, -∞) is an endofunctor F on C with a natural transformation fs_{A,B} : A -∞ B → FA -∞ FB internalizing the functorial action of F.
- There is a bijective correspondence between tensorially and functorially strong endofunctors, in fact an equivalence between their categories.
- Given fs, one defines sl by

$$\mathsf{sl}_{A,B} =_{\mathrm{df}} A \otimes FB \stackrel{\mathsf{coev} \otimes \mathsf{id}}{\longrightarrow} (B \multimap A \otimes B) \otimes FB \stackrel{\wedge^{-1}(\mathsf{fs})}{\longrightarrow} F(A \otimes B)$$

Given sl, one defines fs by

$$\mathsf{fs}_{A,B} =_{\mathrm{df}} \Lambda((A \multimap B) \otimes FA \overset{\mathsf{sl}}{\longrightarrow} F((A \multimap B) \otimes A) \overset{Fev}{\longrightarrow} FB)$$

On **Set**, every monad is $(1, \times)$ strong

• Any endofunctor on **Set** has a unique functorial strength and any natural transformation between endofuctors on **Set** is functorially strong.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

• Hence any monad on **Set** is both functorially and tensorially strong.

Effects

- Of course we want the Kleisli category of a monad to contain more maps than the base category.
- To describe those, we must single out some proper sources of effectfulness. How to choose those is a topic on its own.
- E.g., for the exceptions monad, an important map is raise $=_{df} E \xrightarrow{inr} A + E$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Semantics of pure typed lambda calculus

- Pure typed lambda calculus can be interpreted into any Cartesian closed category *C*, e.g., **Set**.
- The interpretation is this:

$$\begin{bmatrix} K \end{bmatrix} =_{df} \text{ an object of } \mathcal{C}$$
$$\begin{bmatrix} A \times B \end{bmatrix} =_{df} \begin{bmatrix} A \end{bmatrix} \times \begin{bmatrix} B \end{bmatrix}$$
$$\begin{bmatrix} A \Rightarrow B \end{bmatrix} =_{df} \begin{bmatrix} A \end{bmatrix} \times \begin{bmatrix} B \end{bmatrix}$$
$$\begin{bmatrix} C \end{bmatrix} =_{df} \begin{bmatrix} C_0 \end{bmatrix} \times \dots \times \begin{bmatrix} C_{n-1} \end{bmatrix}$$
$$\begin{bmatrix} (\underline{x}) x_i \end{bmatrix} =_{df} \pi_i$$
$$\begin{bmatrix} (\underline{x}) x_i \end{bmatrix} =_{df} \pi_i$$
$$\begin{bmatrix} (\underline{x}) x_i \end{bmatrix} =_{df} \text{ fst} \circ \begin{bmatrix} (\underline{x}) t \end{bmatrix}$$
$$\begin{bmatrix} (\underline{x}) fst(t) \end{bmatrix} =_{df} \text{ fst} \circ \begin{bmatrix} (\underline{x}) t \end{bmatrix}$$
$$\begin{bmatrix} (\underline{x}) snd(t) \end{bmatrix} =_{df} \text{ snd} \circ \begin{bmatrix} (\underline{x}) t \end{bmatrix}$$
$$\begin{bmatrix} (\underline{x}) (t_0, t_1) \end{bmatrix} =_{df} \wedge (\begin{bmatrix} (\underline{x}) t_0 \end{bmatrix}, \begin{bmatrix} (\underline{x}) t_1 \end{bmatrix}$$
$$\begin{bmatrix} (\underline{x}) \lambda xt \end{bmatrix} =_{df} \Lambda (\begin{bmatrix} (\underline{x}, x) t \end{bmatrix})$$

・ロト ・ 日 ・ ・ ヨ ・ ・ 日 ・ ・ の へ ()・

 This interpretation is sound: derivable typing judgements of the pure typed lambda calculus are valid, i.e.,

$$\underline{x}: \underline{C} \vdash t : A \text{ implies } \llbracket (\underline{x}) t \rrbracket : \llbracket \underline{C} \rrbracket \to \llbracket A \rrbracket$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

and the same holds true about all derivable equalities.

• This interpretation is also complete.

Pre-[Cartesian closed] structure of the Kleisli category of a strong monad

- Given a Cartesian (closed) category C and a (1, ×) strong monad T on it, how much of that structure carries over to KI(T)?
- We can manufacture "pre-products" in **KI**(*T*) using the products of *C* and the strength sl like this:

$$\begin{array}{rcl} A_0 \times^{\mathcal{T}} A_1 & =_{\mathrm{df}} & A_0 \times A_1 \\ & \mathsf{fst}^{\mathcal{T}} & =_{\mathrm{df}} & \eta \circ \mathsf{fst} \\ & \mathsf{snd}^{\mathcal{T}} & =_{\mathrm{df}} & \eta \circ \mathsf{snd} \\ & \langle k_0, k_1 \rangle^{\mathcal{T}} & =_{\mathrm{df}} & \mathsf{sl}^* \circ \mathsf{sr} \circ \langle k_0, k_1 \rangle \end{array}$$

・ロト ・ 日 ・ モ ト ・ モ ・ うへぐ

$$\frac{k: C \to TA \quad \ell: C \times A \to TB}{\ell \bullet^{T} k =_{df}}$$

$$C \xrightarrow{\langle id_{C}, k \rangle} C \times TA \xrightarrow{sl_{C,A}} T(C \times A) \xrightarrow{\ell^{*}} TB$$

$$fst^{T} =_{df} A_{0} \times A_{1} \xrightarrow{fst} A_{0} \xrightarrow{\eta} TA_{0}$$

$$snd^{T} =_{df} A_{0} \times A_{1} \xrightarrow{snd} A_{1} \xrightarrow{\eta} TA_{1}$$

$$\frac{k_{0}: C \to TA_{0} \quad k_{1}: C \to TA_{1}}{\langle k_{0}, k_{1} \rangle^{T} =_{df}}$$

$$C \xrightarrow{\langle k_{0}, k_{1} \rangle} TA_{0} \times TA_{1} \xrightarrow{sr_{A_{0}, TA_{1}}} T(A_{0} \times TA_{1}) \xrightarrow{sl_{A_{0}, A_{1}}} T(A_{0} \times A_{1})$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ ▲□ ● ● ●

- The typing rules of products hold, but not all laws.
- In particular, we do not get the β -law of products. Effects cannot be undone!
- E.g., taking T to be the exception monad defined by $TA =_{df} A + E$ for some fixed E we do not have $\operatorname{snd}^T \circ^T \langle k_0, k_1 \rangle^T = k_1$.
- Take $k_0 =_{df}$ raise = inr : $E \to TA$, $k_1 =_{df} id^T = inl : E \to TE$ Then $\langle k_0, k_1 \rangle^T = inr : E \to T(A \times E)$ and hence $snd^T \circ^T \langle k_0, k_1 \rangle^T = inr \neq inl = k_1$.
- In fact, ×^T is not even a bifunctor unless T is commutative, although it is functorial in each argument separately. Effects do not commute in general!

 \bullet "Pre-exponents" are defined from the exponents of ${\mathcal C}$ by

$$\operatorname{ev}_{A,B}^{T} =_{\operatorname{df}} (A \Rightarrow TB) \times A \xrightarrow{\operatorname{ev}_{A,TB}} TB$$

$$\frac{k: C \times A \to TB}{\Lambda^{T}(k) =_{df} C \xrightarrow{\Lambda(k)} A \Rightarrow TB \xrightarrow{\eta} T(A \Rightarrow TB)}$$

◆□▶ ◆□▶ ◆∃▶ ◆∃▶ = のへで

It is not true that A ⇒^T - : KI(T) → KI(T) is right adjoint to -×^T A : KI(T) → KI(T). So ⇒^T is not a true exponent wrt. the preproduct ×^T.

• But
$$A \Rightarrow^{T} - : \mathbf{KI}(T) \to C$$
 is right adjoint to $J(-\times A) : C \to \mathbf{KI}(T)$:

$$\frac{J(C \times A) \to^{T} B}{\frac{C \times A \to TB}{\frac{C \to A \Rightarrow TB}{C \to A \Rightarrow^{T} B}}}$$

We that say $A \Rightarrow^T B$ is the *Kleisli exponent* of *A*, *B*.

 More about the pre-[Cartesian closed] structure of Kleisli categories in the story about arrows.

CoCartesian structure of the Kleisli category of a monad

- If C is coCartesian (has coproducts), then KI(T) is coCartesian too, since J as a left adjoint preserves colimits.
- Concretely, the coproduct on KI(T) is defined by

$$\begin{array}{rcl} A_0 + {}^{\mathcal{T}} A_1 & =_{\mathrm{df}} & A_0 + A_1 \\ & \operatorname{inl}^{\mathcal{T}} & =_{\mathrm{df}} & \eta \circ \operatorname{inl} \\ & \operatorname{inr}^{\mathcal{T}} & =_{\mathrm{df}} & \eta \circ \operatorname{inr} \\ & [k_0, k_1]^{\mathcal{T}} & =_{\mathrm{df}} & [k_0, k_1] \end{array}$$

Semantics of an effectful language

- In the semantics of an effectful language, the semantic universe is the Kleisli category KI(T) of the appropriate strong monad T on a Cartesian closed base category C.
- The pure fragment is interpreted into KI(T) as if the language was pure, using the pre-[Cartesian closed] structure:

$$\begin{bmatrix} \mathcal{K} \end{bmatrix}^T =_{df} \text{ an object of } \mathbf{KI}(T)$$

= that object of \mathcal{C}
$$\begin{bmatrix} \mathcal{A} \times \mathcal{B} \end{bmatrix}^T =_{df} \begin{bmatrix} \mathcal{A} \end{bmatrix}^T \times^T \begin{bmatrix} \mathcal{B} \end{bmatrix}^T$$

$$= \begin{bmatrix} \mathcal{A} \end{bmatrix}^T \times \begin{bmatrix} \mathcal{B} \end{bmatrix}^T$$

$$\begin{bmatrix} \mathcal{A} \Rightarrow \mathcal{B} \end{bmatrix}^T =_{df} \begin{bmatrix} \mathcal{A} \end{bmatrix}^T \Rightarrow^T \begin{bmatrix} \mathcal{B} \end{bmatrix}^T$$

$$= \begin{bmatrix} \mathcal{A} \end{bmatrix}^T \Rightarrow T \begin{bmatrix} \mathcal{B} \end{bmatrix}^T$$

$$\begin{bmatrix} \mathcal{L} \end{bmatrix}^T =_{df} \begin{bmatrix} \mathcal{C}_0 \end{bmatrix}^T \times^T \dots \times^T \begin{bmatrix} \mathcal{C}_{n-1} \end{bmatrix}^T$$

$$= \begin{bmatrix} \mathcal{C}_0 \end{bmatrix}^T \times \dots \times \begin{bmatrix} \mathcal{C}_{n-1} \end{bmatrix}^T$$

$$\begin{split} \llbracket (\underline{x}) x_i \rrbracket^T &=_{\mathrm{df}} \quad \pi_i^T \\ &= \eta \circ \pi_i \\ \llbracket (\underline{x}) \operatorname{let} x \leftarrow t \text{ in } u \rrbracket^T &=_{\mathrm{df}} \quad \llbracket (\underline{x}, x) u \rrbracket^T \circ^T \langle \operatorname{id}^T, \llbracket (x) t \rrbracket^T \rangle^T \\ &= (\llbracket (\underline{x}, x) u \rrbracket^T)^* \circ \operatorname{sl} \circ \langle \operatorname{id}, \llbracket (x) t \rrbracket^T \rangle \\ \llbracket (\underline{x}) \operatorname{fst}(t) \rrbracket^T &=_{\mathrm{df}} \quad \operatorname{fst}^T \circ^T \llbracket (\underline{x}) t \rrbracket^T \\ &= T \operatorname{fst} \circ \llbracket (\underline{x}) t \rrbracket^T \\ \llbracket (\underline{x}) \operatorname{snd}(t) \rrbracket^T &=_{\mathrm{df}} \quad \operatorname{snd}^T \circ^T \llbracket (\underline{x}) t \rrbracket^T \\ \llbracket (\underline{x}) \operatorname{snd}(t) \rrbracket^T &=_{\mathrm{df}} \quad \operatorname{snd}^T \circ^T \llbracket (\underline{x}) t \rrbracket^T \\ \llbracket (\underline{x}) \operatorname{to} t_1 \rrbracket^T &=_{\mathrm{df}} \quad \langle \llbracket (\underline{x}) t_0 \rrbracket^T, \llbracket (\underline{x}) t_1 \rrbracket^T \rangle^T \\ &= \operatorname{sl}^* \circ \operatorname{sr} \circ \langle \llbracket (\underline{x}) t_0 \rrbracket^T, \llbracket (\underline{x}) t_1 \rrbracket^T \rangle \\ \llbracket (\underline{x}) \lambda x t \rrbracket^T &=_{\mathrm{df}} \quad \Lambda^T (\llbracket (\underline{x}, x) t \rrbracket^T) \\ &= \eta \circ \Lambda (\llbracket (\underline{x}, x) t \rrbracket^T) \\ \llbracket (\underline{x}) t u \rrbracket^T &=_{\mathrm{df}} \quad \operatorname{ev}^T \circ^T \langle \llbracket (\underline{x}) t \rrbracket^T, \llbracket (\underline{x}) u \rrbracket^T \rangle^T \\ &= \operatorname{ev}^* \circ \operatorname{sl}^* \circ \operatorname{sr} \circ \langle \llbracket (\underline{x}) t \rrbracket^T, \llbracket (\underline{x}) u \rrbracket^T \rangle \end{split}$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ ▲□ ● ● ●

 As KI(T) is only pre-Cartesian closed, for this pure fragment, soundness of typing holds, i.e.,

$$\underline{x}: \underline{C} \vdash t: A \text{ implies } \llbracket(\underline{x}) t \rrbracket^{\mathcal{T}}: \llbracket\underline{C}\rrbracket^{\mathcal{T}} \to^{\mathcal{T}} \llbracketA \rrbracket^{\mathcal{T}}$$

but not all equations of the pure typed lambda-calculus are validated.

• In particular,

$$\vdash t : A \text{ implies } \llbracket t \rrbracket^{\mathcal{T}} : 1 \to^{\mathcal{T}} \llbracket A \rrbracket^{\mathcal{T}}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

so a closed term t of a type A denotes an element of $T[A]^{T}$.

 Any effect-constructs must be interpreted specifically validating their desired typing rules and equations.
 E.g., for a language with exceptions we would use the exceptions monad and define

$$\begin{array}{ll} \llbracket (\underline{x}) \ \textit{raise}(e) \rrbracket^{\mathcal{T}} &=_{\mathrm{df}} & \mathsf{raise} \circ^{\mathcal{T}} \llbracket (\underline{x}) \ e \rrbracket^{\mathcal{T}} \\ &= \mathsf{raise}^{\star} \circ \llbracket (\underline{x}) \ e \rrbracket^{\mathcal{T}} \end{array}$$

・ロト・日本・モート モー うへぐ

Kleisli adjunction

- Given a monad T on category C, in the opposite direction to that of J : C → KI(T) there is a functor U : KI(T) → C defined by
 UA =_{df} TA,
 if k : A →^T B, then Uk =_{df} TA → TB.
- U is right adjoint to J.

• Importantly, UJ = T. Indeed,

• UJA = TA,

- if $f: A \to B$, then $UJf = (\eta_B \circ f)^* = Tf$.
- Moreover, the unit of the adjunction is η .
- J ⊢ U is the initial adjunction factorizing T in this way.
 There is also a final one, known as the Eilenberg-Moore.

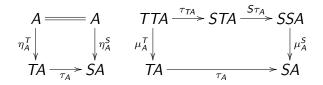

Kleisli categories

- In general one can define a Kleisli category on ${\mathcal C}$ to be
 - $\bullet\,$ a category ${\cal D}$ with the same objects as ${\cal C}$
 - together with an identity-on-objects functor $J : \mathcal{C} \to \mathcal{D}$ with right adjoint U.
- To give a monad is the same as to give Kleisli category.
- We already know that a monad T induces a Kleisli category $\mathcal{D} =_{df} \mathbf{KI}(T)$.
- Given a Kleisli category $\mathcal{D},$ we obtain a monad by taking $\mathcal{T}=_{\rm df} \textit{UJ}.$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Monad maps

A monad map between monads T, S on a category C is a natural transformation τ : T → S satisfying

- Alternatively, a map between two monads (Kleisli triples) *T*, *S* is, for any object *A*, a map τ_A : *TA* → *SA* satisfying
 τ_A ∘ η^T_A = η^S_A,
 if k : A → *TB*, then τ_B ∘ k^{*T} = (τ_B ∘ k)^{*S} ∘ τ_A. (No explicit naturality condition on τ.)
- The two definitions are equivalent.
- Monads on C and maps between them form a category Monad(C).

Monad maps vs. functors between Kleisli categories

- There is a bijection between monad maps τ between T, S and functors $V : \mathbf{KI}(T) \to \mathbf{KI}(S)$ satisfying $VJ^T = J^S$.
- Given τ , one defines V by

•
$$VA =_{df} A$$
,

• if $k : A \to TB$, then $Vk =_{\mathrm{df}} A \xrightarrow{k} TB \xrightarrow{\tau_B} SB$.

• Given V, one defines au by

•
$$\tau_A =_{\mathrm{df}} V(TA \xrightarrow{\mathrm{id}_{TA}} TA) : TA \to^S A.$$

Monads and More: Part 2

Monads from adjuctions (Huber)

 For any pair of adjoint functors L : C → D, R : D → C, L ⊢ R with unit η : Id_C → RL and counit ε : LR → Id_D, the functor RL carries a monad structure defined by

•
$$\eta^{RL} =_{df} \mathsf{Id} \xrightarrow{\eta} RL$$
,
• $\mu^{RL} =_{df} RLRL \xrightarrow{R \in L} RL$.

• The Kleisli and Eilenberg-Moore adjunctions witness that any monad on ${\cal C}$ admits a factorization like this.

Examples

State monad:

•
$$L, R : C \to C, LA =_{df} A \times S, RB =_{df} S \Rightarrow B,$$

$$\frac{A \times S \to B}{A \to S \Rightarrow B}$$

• $RLA = S \Rightarrow A \times S$,

An exotic one:

• $L, R : C \to C$, $LA =_{df} \mu X.A + X \times S \cong A \times ListS$, $RB =_{df} \nu Y.B \times (S \Rightarrow Y)$,

$$\frac{\mu X.A + X \times S \to B}{A \to \nu Y.B \times (S \Rightarrow Y)}$$

- $RLA = \nu Y.(\mu X.A + X \times S) \times (S \Rightarrow Y) \cong \nu Y.A \times \text{List}S \times (S \Rightarrow Y).$
- What notion of computation does this correspond to?

• Continuations monad:

•
$$L: \mathcal{C} \to \mathcal{C}^{\mathrm{op}}, LA =_{\mathrm{df}} A \Rightarrow E,$$

 $R: \mathcal{C}^{\mathrm{op}} \to \mathcal{C}, RB =_{\mathrm{df}} B \Rightarrow E,$

$$\frac{A \Rightarrow E \leftarrow B}{E \leftarrow B \times A} \\
\frac{A \Rightarrow B \Rightarrow E}{A \Rightarrow B \Rightarrow E}$$

•
$$RLA = (A \Rightarrow E) \Rightarrow E$$
.

Monads from adjunctions ctd.

- Given two functors L : C → D and R : D → C, L ⊢ R and a monad T on D, we obtain that RTL is a monad on C.
- This is because *T* factorizes as *UJ* where *J* ⊢ *U* is the Kleisli adjunction.

That means an adjoint situation $JL \vdash RU$ implying that RUJL = RTL is a monad.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

• The monad structure is

•
$$\eta^{RTL} =_{df} Id \xrightarrow{\eta} RL \xrightarrow{R\eta^T L} RTL,$$

• $\mu^{RTL} =_{df} RTLRTL \xrightarrow{RT \in TL} RTTL \xrightarrow{\mu^T} RTL.$

Examples

- State monad transformer:
 - $L, R : \mathcal{C} \to \mathcal{C}, LA =_{\mathrm{df}} A \times S, RB =_{\mathrm{df}} S \Rightarrow B,$
 - $T a \mod c$,
 - $RTLA = S \Rightarrow T(A \times S)$,
 - In particular, for T the exceptions monad we get $RTLA = S \Rightarrow (A \times S) + E$.
- Continuations monad transformer:

•
$$L: \mathcal{C} \to \mathcal{C}^{\mathrm{op}}, LA =_{\mathrm{df}} A \Rightarrow E,$$

 $R: \mathcal{C}^{\mathrm{op}} \to \mathcal{C}, RB =_{\mathrm{df}} B \Rightarrow E,$

• T – a monad on C^{op} , i.e., a comonad on C,

• $RTLA =_{df} T(A \Rightarrow E) \rightarrow E.$

Free algebras, free monads

Given a endofunctor H on a category C, let
 (H*A, [η^H_A, τ^H_A]) be the initial algebra of A + H− (if it
 exists), so that, for any A + H−-algebra (C, [g, h]), there
 is a unique map f : H*A → C satisfying

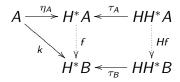

• *H***A* is the type of wellfounded *H*-trees with mutable leaves from *A*, i.e., of *H*-terms over variables from *A*.

((H*A, τ_A^H), η_A^H) is the free H-algebra on A,
 i.e., A → (H*A, τ^HA) : C → alg(H) is left adjoint to the forgetful functor U : alg(H) → C.

$$\frac{(H^*A, \tau_A) \to (C, h)}{\frac{A \to C}{\overline{A \to U(C, h)}}}$$

and η^{H} is the unit of the adjunction.

- The pointed functor (H^*, η^H) carries a monad structure.
- The Kleisli extension k^{*} : H^{*}A → H^{*}B of any given map k : A → H^{*}B is defined as the unique map f satisfying

Intuitively, this is grafting of trees into the mutable leaves of a tree or substitution of terms into the variables of a term.

・ロト・日本・モート モー うへぐ

((H^{*}, η^H, μ^H), τ^H) is the free monad on H,
 i.e., H → (H^{*}, η^H, μ^H) : [C, C] → Monad(C) is left
 adjoint to the forgetful functor U : Monad(C) → [C, C]

$$\frac{(H^*, \eta^H, \mu^H) \to (S, \eta^S, \mu^S)}{\frac{H \to S}{H \to U(S, \eta^S, \mu^S)}}$$

and τ is the unit of the adjunction.

Free completely iterative algebras, free completely iterative monads (Adámek, Milius, Velebil)

The final coalgebras H[∞]A of A + H− (the free completely iterative H-algebras over A) for each A also a give a monad (the free completely iterative monad on H).

(ロ)、(同)、(E)、(E)、(E)、(O)へ(C)

Examples

 If HX = 1 + X × X, then H*A is the type of wellfounded binary trees with a termination option and with mutable leaves from A

(i.e., terms in the signature with one nullary, one binary operator over variables from A).

If HX =_{df} ListX ≅ ∐_{i∈ℕ} Xⁱ, then H*A is the type of wellfounded rose trees with mutable leaves from A (i.e., terms in the signature with one operator of every finite arity over variables from A).

・ロト ・ 日 ・ モ ト ・ モ ・ うへぐ

Monads from parameterized monads via initial algebras / final coalgebras (U.)

- A parameterized monad on C is a functor $F : C \to Monad(C)$.
- If *F* is a parameterized monad then the functors $F^*, F^{\infty} : \mathcal{C} \to \mathcal{C}$ defined by $F^*A =_{df} \mu X.FXA$ and $F^{\infty}A =_{df} \nu X.FXA$ carry a monad structure.
- In fact more can be said about them, but here we won't.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Examples

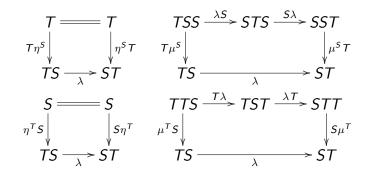

- Free monads:
 - $FXA =_{df} A + HX$ where $H : \mathcal{C} \to \mathcal{C}$,
 - $F^*A =_{\mathrm{df}} \mu X.A + HX$, $F^{\infty}A =_{\mathrm{df}} \nu X.A + HX$.
 - These are the types of wellfounded/nonwellfounded *H*-trees with mutable leaves from *A*.
- Rose tree types:
 - $FXA =_{df} A \times HX$ where $H : C \rightarrow Monoid(C)$,
 - $F^*A =_{df} \mu X.A \times HX$, $F^{\infty}A =_{df} \nu X.A \times HX$.
 - If HX =_{df} ListX, these are the types of wellfounded/nonwellfounded A-labelled rose trees.

- Types of hyperfunctions with a fixed domain:
 - $FXA =_{\mathrm{df}} HX \Rightarrow A$ where $H : \mathcal{C} \to \mathcal{C}^{\mathrm{op}}$,
 - $F^*A =_{\mathrm{df}} \mu X.HX \Rightarrow A, F^{\infty}A =_{\mathrm{df}} \nu X.HX \Rightarrow A.$
 - If FX =_{df} X ⇒ E, these are the types of wellfounded/nonwellfounded hyperfunctions from E to A. (Of course these types do no exist in Set.)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Distributive laws

- If *T*, *S* are monads on *C*, it is not generally the case that *ST* is a monad. But sometimes it is.
- A distributive law of a monad T over a monad S is a natural transformation $\lambda : TS \rightarrow ST$ satisfying

 A distributive law λ of T over S gives a monad structure on the endofunctor ST:

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 善臣 - のへぐ

•
$$\eta^{ST} =_{df} \operatorname{Id} \stackrel{\eta^{S}\eta^{T}}{\longrightarrow} ST$$
,
• $\mu^{ST} =_{df} STST \stackrel{S\lambda T}{\longrightarrow} SSTT \stackrel{\mu^{S}\mu^{T}}{\longrightarrow} ST$.

Examples

- The exceptions monad distributes over any monad.
 - S a monad,
 - $TA =_{df} A + E$ where E is an object,
 - $\lambda =_{\mathrm{df}} SA + E \xrightarrow{\mathrm{id} + \eta^S} SA + SE \xrightarrow{[Sinl,Sinr]} S(A + E),$
 - STA = S(A + E).
 - For T the state monad, this gives $ST = S \Rightarrow (A + E) \times S$, which is a different combination of exceptions and state than we saw before.

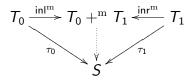

- The output monad distributes over any $(1, \times)$ strong monad.
 - (S, sl) a strong monad,
 - $TA =_{df} A \times E$ where E is a monoid,
 - $\lambda =_{\mathrm{df}} SA \times E \xrightarrow{\mathrm{sr}} S(A \times E),$
 - $STA = S(A \times E)$.

• Any (1, ×) strong monad distributes over the environment monad.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 善臣 - のへぐ

Coproduct of monads

- An interesting canonical way to combine monads is the coproduct of monads.
- A coproduct of two monads T₀ and T₁ on C is their coproduct in Monad(C).
- I.e., it is a monad T₀ +^m T₁ together with two monad maps inl^m: T₀ →^m T₀ +^m T₁, inr^m: T₀ →^m T₀ +^m T₁ such that for any monad S and monad maps τ₀: T₀ →^m S, τ₁: T₁ →^m S there exists a unique monad map T₀ +^m T₁ →^m S satisfying

- The coproduct of two monads cannot be computed "pointwise", it is not the coproduct of the underlying functors.
- In fact, most of the time the coproduct of the underlying functors of two monads is not even a monad.

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ○ □ ○ ○ ○ ○

Coproduct of free monads

• The coproduct of the free monads on functors *H*₀, *H*₁ is the free monad on their coproduct:

$$H_0^{\star} +^{\mathrm{m}} H_1^{\star} = (H_0 + H_1)^{\star}$$

(obvious, since the free monad delivering functor is a left adjoint and hence preserves colimits, in particular coproducts).

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Coproduct of a free monad and an arbitrary monad (Power)

 More generally, the coproduct of a free monad H* with an arbitary monad S is this (if (HS)* exists):

$$H^* +^{\mathrm{m}} S = S(HS)^*$$

i.e.,

$$(H^* + {}^{\mathrm{m}}S)A = S(\mu X.A + HSX) = \mu X.S(A + HX)$$

For HX =_{df} E, H*A = µX.A + E ≅ A + E (exceptions monad) and (H* +^m S)A = µX.S(A + E) ≅ S(A + E). This is the same combination of exceptions with any other monad as obtained from the canonical distributive law of the exceptions monad over another monad.

Ideal monads (Adámek, Milius, Velebil)

- Idea: to generalize the separation of variables from operator terms in term algebras.
- An *ideal monad* on C is a monad (T, η, μ) together with an endofunctor T' on C and a natural transformation
 - μ' : $T'T \xrightarrow{\cdot} T'$ such that

•
$$T = Id + T'$$
,

•
$$\eta = \mathsf{inl}$$
,

•
$$\mu = [id, inr \circ \mu'].$$

 An ideal monad map between T = Id + T' and S = Id + S' is monad map τ : T → S together with a nat. transf. τ' : T' → S' satisfying τ = id + τ'.

Examples

- Free monads are ideal:
 - $TA =_{df} \mu X.A + HX$ where $H : C \to C$
 - $TA \cong A + HTA$
- The finite powerset monad is not ideal:
 - $TA =_{df} \mathcal{P}_{f}$
 - $TA \cong A + 1 + \mathcal{P}_{\geq 2}A$, but $\mathcal{P}_{\geq 2}$ is not a functor: If for some $f : A \to B$ and $a_0, a_1 \in A$ we have $f(a_0) = f(a_1)$, then $\mathcal{P}_{\mathrm{f}}f$ sends a 2-element set $\{a_0, a_1\}$ to singleton.
- The finite multiset monad is not ideal:
 - $TA =_{df} \mathcal{M}_{f}$
 - $TA \cong A + 1 + \mathcal{M}_{\geq 2}A$, but μ does not restrict to a nat. transf. $\mathcal{M}_{\geq 2}\mathcal{M}_{f} \xrightarrow{\cdot} \mathcal{M}_{\geq 2}$: If $a \in A$, then $\mu_{A}\{\{a\}, \emptyset\} = \{a\}$.

• The nonempty finite multiset monad is ideal:

•
$$TA =_{\mathrm{df}} \mathcal{M}_{\geq 1}$$

•
$$TA \cong A + \mathcal{M}_{\geq 2}A$$

• The nonempty list monad is ideal too.

Coproduct of ideal monads (Ghani, U.)

• Given two ideal monads $S_0 = Id + S'_0$ and $S_1 = Id + S'_1$, their coproduct is the ideal monad $T = Id + T'_0 + T'_1$ defined by

 $(T'_0A, T'_1A) =_{\mathrm{df}} \mu(X_0, X_1).(S'_0(A + X_1)), S'_1(A + X_0))$

Monads and More: Part 3

Arrows (Hughes)

- Arrows are a generalization of strong monads on symmetric monoidal categories (in their Kleisli triple form).
- An arrow on a symmetric monoidal category (C, I, ⊗) is given by
 - an object mapping $R : |\mathcal{C}| \times |\mathcal{C}| \rightarrow |\mathbf{Set}|$,
 - for any objects A, B of C, a map arr : Hom_C $(A, B) \rightarrow R(A, B)$ of **Set**,
 - for any objects A, B, C of C, a map $\ll : R(A, B) \times R(B, C) \rightarrow R(A, C)$ of **Set**,
 - for any objects A, B, C of C, a map second_C : $R(A, B) \rightarrow R(C \otimes A, C \otimes B)$ of **Set**

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

satisfying the conditions on the next slide.

Examples

- Arrows from strong monoidal functors:
 - $R(A, B) =_{df} Hom_{\mathcal{C}}(FA, FB)$ where F is a monoidal endofunctor on \mathcal{C} (i.e., there is a natural isomorphism $m_{A,B} : FA \otimes FB \rightarrow F(A \otimes B)$,
 - if $f : A \rightarrow B$, then arr $f = Ff : FA \rightarrow FB$,
 - if $k : FA \to FB$, $\ell : FB \to FC$, then $\ell \lll k =_{\mathrm{df}} FA \xrightarrow{k} FB \xrightarrow{\ell} FC$,
 - if $k : FA \to FB$, then second $k =_{\mathrm{df}} F(C \otimes A) \xrightarrow{\mathsf{m}^{-1}} FC \otimes FA \xrightarrow{\mathsf{id} \otimes k} FC \otimes FB \xrightarrow{\mathsf{m}} F(C \otimes B)$.

- Kleisli maps of strong monads:
 - $R(A,B) =_{df} Hom_{\mathcal{C}}(A, TB)$ where T is a strong monad,
 - if $f : A \rightarrow B$, then arr $f = Jf : A \rightarrow TB$ where J is the Kleisli inclusion of T,

• if
$$k : A \to TB$$
, $\ell : B \to TC$, then
 $\ell \lll k =_{\mathrm{df}} A \xrightarrow{k} TB \xrightarrow{\ell^*} TC$,

• if $k : A \to TB$, then second $k =_{df} C \otimes A \xrightarrow{id \otimes k} C \otimes TB \xrightarrow{sr} T(C \otimes B)$.

• CoKleisli maps of comonads on Cartesian categories:

- $R(A,B) =_{df} Hom_{\mathcal{C}}(DA,B)$ where D is a comonad on C,
- if f : A → B, then arr f = Jf : DA → B where J is the coKleisli inclusion of D,
- if $k : DA \to B$, $\ell : DB \to C$, then $\ell \lll k =_{\mathrm{df}} DA \xrightarrow{k^{\dagger}} DB \xrightarrow{\ell} C$,
- if $k : DA \to B$, then second $k =_{df} D(C \times A) \xrightarrow{\langle Dfst, Dsnd \rangle} DC \times DA \xrightarrow{\varepsilon \times k} C \times B$.

- Output once more:
 - R(A, B) =_{df} E × Hom_C(A, B) where (E, e, m) is a monoid in Set,
 - if $f : A \rightarrow B$, then arr $f = (e, f) : E \times \operatorname{Hom}_{\mathcal{C}}(A, B)$,
 - if $(x, f) : E \times Hom_{\mathcal{C}}(A, B)$, $(y, g) : E \times Hom_{\mathcal{C}}(B, C)$, then

 $(y,g) \ll (x,f) =_{df} (m(x,y), g \circ f) \in E \times Hom_{\mathcal{C}}(A, C),$ • if $(x,f) : E \times Hom_{\mathcal{C}}(A, B)$, then

second $(x, f) = d_f (x, C \otimes f) \in E \times Hom_C(C \otimes A, C \otimes B).$

Arrows in the monoid form (Jacobs, Heunen, Hasuo)

- An alternative definition mimicks the definition of monads in the standard, i.e., monoid form.
- An arrow on a symmetric monoidal category (C, I, ⊗) is a strong monoid in the category of endoprofunctors on (C, I, ⊗).
- A profunctor from C to D is a functor $C^{op} \times D \to \mathbf{Set}$. The identity profunctor on C is $\mathsf{Id} =_{\mathrm{df}} \mathsf{Hom}_{C} : C^{op} \times C \to \mathbf{Set}$. The composition of profunctors $R : C \to D$ and $S : D \to \mathcal{E}$ is $SR(A, C) =_{\mathrm{df}} \int^{B} R(A, B) \times S(B, C)$.

- Accordingly, the data of an arrow are the following.
 - The carrier of an arrow is a profunctor R from C to C, i.e., a functor $R : C^{op} \times C \rightarrow \mathbf{Set}$.
 - The unit is a natural transformation from Id to R, i.e., a family of maps arr_{A,B} : Hom_C(A, B) → R(A, B) natural in A, B.

The multiplication is a nat. transf. from RR to R, i.e., a family of maps $\ll_{A,B,C} : R(A,B) \times R(B,C) \rightarrow R(A,C)$ natural in A, C and dinatural in B.

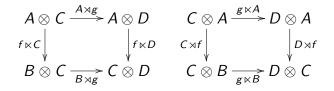

The strength is a family of

second_{A,B,C} :: $R(A,B) \rightarrow R(C \otimes A, C \otimes B)$ natural in A, B and dinatural in C.

Symmetric premonoidal categories (Power, Robinson)

- Intuitively, a symmetric premonoidal category is the same as a symmetric monoidal category, except that the tensor is not necessarily a bifunctor, it must only be functorial in each argument separately.
- More officially: A symmetric premonoidal category is given by
 - $\bullet\,$ a category ${\cal K},$
 - an object I of \mathcal{K} ,
 - for any object A, a functor $A \rtimes : \mathcal{K} \to \mathcal{K}$,
 - natural isomorphisms a, ul, ur, c satisfying the laws of a symmetric monoidal category and have all their components central (see further).

- Symmetry yields symmetric functors − × A : K → K where A₀ × A₁ = A₀ × A₁ (which we also denote more symmetrically by A₀ ⊗ A₁).
- A morphism f : A → B is called *central* if, for any g : C → D, both

Freyd categories

- \bullet A Freyd category on a symmetric monoidal category ${\mathcal C}$ is given by
 - a symmetric premonoidal category $(\mathcal{K}, I^{\mathcal{K}}, \otimes^{\mathcal{K}})$ with the same objects as $\mathcal C$
 - together with an identity-on-objects inclusion functor J: C → K that preserves centrality and strictly preserves its the (I, ⊗) structure as premonoidal (meaning that I^K = I, A ⊗^K B = A ⊗ B).

Freyd categories vs. arrows (Jacobs, Heunen, Hasuo)

- Freyd categories are in a bijection with arrows.
- For an arrow R on a symmetric monoidal category (C, I, ⊗), the Freyd category ((K, I^K, ⊗^K), J) is defined by
 - $\bullet\,$ an object is an object of $\mathcal{C},$
 - a map from A to B is an element of R(A, B),

•
$$\mathsf{id}^\mathcal{K}_A =_{\mathrm{df}} \mathsf{arr} \mathsf{id}_A$$

• if $k : A \to^{\mathcal{K}} B$, $\ell : B \to^{\mathcal{K}} C$, then $\ell \circ^{\mathcal{K}} k =_{\mathrm{df}} \ell \lll k$,

•
$$I^{\mathcal{K}} = I, A \otimes^{\mathcal{K}} B =_{\mathrm{df}} A \otimes B,$$

- if $k : A \to^{\mathcal{K}} B$, then $C \rtimes^{\mathcal{K}} k =_{df} second k$,
- if $f : A \to B$, then $Jf =_{df} arr f$.

- Given a Freyd category ((𝔅, 𝑘, ⊗𝔅), 𝑌) on 𝔅, the corresponding arrow 𝑘 is defined by
 - $R(A,B) =_{\mathrm{df}} \mathrm{Hom}_{\mathcal{K}}(A,B)$,
 - if $f : A' \to A$, $g : B \to B'$, $k \in \text{Hom}_{\mathcal{K}}(A, B)$, then $R(f, g) k =_{\text{df}} Jg \lll k \lll Jf$,
 - if $f : A \rightarrow B$, then arr $f =_{df} Jf \in Hom_{\mathcal{K}}(A, B)$,
 - if $k \in \operatorname{Hom}_{\mathcal{K}}(A, B)$, $\ell \in \operatorname{Hom}_{\mathcal{K}}(B, C)$, then $\ell \lll k =_{\operatorname{df}} \ell \circ^{\mathcal{K}} k \in \operatorname{Hom}_{\mathcal{K}}(A, C)$,
 - if $k \in \operatorname{Hom}_{\mathcal{K}}(A, B)$, then second $k =_{df} C \rtimes^{\mathcal{K}} k \in \operatorname{Hom}_{\mathcal{K}}(C \otimes A, C \otimes B)$.

When is Freyd Kleisli? (Power)

- Given a Freyd category ((K, I^K, ⊗^K), J) on a symmetric monoidal category (C, I, ⊗), when is it the Kleisli category of a strong monad?
- A simple condition is in terms of Kleisli exponents.
- Suppose J(- ⋉ A) : C → K has a right adjoint A ⇒^K -. In this case we say the Freyd category is *closed*. Then also TB =_{df} I ⇒^K B is a strong monad with Kleisli exponents and ((K, I^K, ⊗^K), J) is its Kleisli category.

Monads and More: Part 4

Tarmo Uustalu, Institute of Cybernetics, Tallinn

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Comonads

- Comonads are the dual of monads.
- A comonad is a
 - a functor $D : C \to C$ (the underlying functor),
 - a natural transformation $\eta: D \rightarrow \mathsf{Id}_{\mathcal{C}}$ (the *counit*),
 - a natural transformation $\delta: D \xrightarrow{\cdot} DD$ (the *comultiplication*)

satisfying these conditions:

In other words, a comonad is comonoid in [C, C] (a monoid in [C, C]^{op}).

CoKleisli triples

- A coKleisli triple is given by
 - an object mapping $D: |\mathcal{C}|
 ightarrow |\mathcal{C}|,$
 - for any object A, a map $\varepsilon_A : DA \to A$,
 - for any map k : DA → B, a map k[†] : DA → DB (the coKleisli extension operation)

satisfying

• if $k : DA \to B$, then $\varepsilon_B \circ k^{\dagger} = k$,

•
$$\varepsilon_A^{\dagger} = \operatorname{id}_{DA}$$
,

• if $k : DA \to B$, $\ell : DB \to C$, then $(\ell \circ k^{\dagger})^{\dagger} = \ell^{\dagger} \circ k^{\dagger}$.

There is a bijection between comonads and coKleisli triples.

CoKleisli category of a comonad

- A comonad D on a category C induces a category
 CoKI(D) called the coKleisli category of D defined by
 - $\bullet\,$ an object is an object of ${\mathcal C},$
 - a map of from A to B is a map of C from DA to B,
 - $\operatorname{id}_{A}^{D} =_{\operatorname{df}} DA \xrightarrow{\varepsilon_{A}} A$,
 - if $k : A \to^{D} B$, $\ell : B \to^{D} C$, then $\ell \circ^{D} k =_{df} DA \xrightarrow{\mu_{A}} DDA \xrightarrow{Dk} DB \xrightarrow{\ell} C$.
- From C there is an identity-on-objects inclusion functor J to CoKI(D), defined on maps by

• if
$$f : A \to B$$
, then
 $Jf =_{df} DA \xrightarrow{\varepsilon_A} A \xrightarrow{f} B = DA \xrightarrow{Df} DB \xrightarrow{\varepsilon_B} B.$

The functor J has a left adjoint U : CoKI(D) → C given by UA =_{df} DA, if k : A →^D B, then Uk =_{df} DA →^{k†} DB.

Comonadic notions of computation

- We think of C as the category of pure functions and of DA as the type of coeffectful computations of values of type A (values in context).
- CoKI(D) is the category of coeffectful or context-dependent functions.
- *ε_A* : *DA* → *A* is the identity on *A* seen as trivially context-dependent (discarding the context).
- Jf : DA → B is a general pure function f : A → B regarded as trivially context-dependen.
- $\delta_A : DA \to DDA$ blows the context of a value up (duplicates the context).
- k[†]: DA → DB is a context-dependent function
 k: DA → B extended into one that can output a value of in a context (e.g., for a postcomposed context-dependent function).

Examples

- Product comonad, for dependency on an environment:
 - $DA =_{df} A \times E$ where E is an object of C,
 - $\varepsilon_A =_{\mathrm{df}} A \times E \xrightarrow{\mathrm{fst}} A$, • $\delta_A =_{\mathrm{df}} A \times E \xrightarrow{\langle \mathrm{id}, \mathrm{snd} \rangle} (A \times E) \times E$, $\varepsilon_A = \varepsilon_A = \varepsilon_A \times E \xrightarrow{\langle \mathrm{id}, \mathrm{snd} \rangle} (A \times E) \times E$,
 - if $k : A \times E \to B$, then $k^{\dagger} =_{\mathrm{df}} A \times E \xrightarrow{\langle k, \mathrm{snd} \rangle} B \times E$.

- This is the dual of the exceptions monad.
- It is not very interesting, as $CoKI(D) \cong KI(T)$ for $TA =_{df} E \Rightarrow A$ (the reader monad).

• Exponent comonad:

•
$$DA =_{df} E \Rightarrow A$$
 where (E, e, m) is a monoid in C ,
• $\varepsilon_A =_{df} (E \Rightarrow A) \xrightarrow{ur^{-1}} (E \Rightarrow A) \times 1$
 $\stackrel{id \times e}{\longrightarrow} (E \Rightarrow A) \times E \xrightarrow{ev} A$,
• $\delta_A =_{df} \Lambda(\Lambda(((E \Rightarrow A) \times E) \times E \xrightarrow{a} (E \Rightarrow A) \times (E \times E))$
 $\stackrel{id \times m}{\longrightarrow} (E \Rightarrow A) \times E \xrightarrow{ev} A)),$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

• Interesting special cases are $(E, e, m) =_{df} (Nat, 0, +)$ and $(E, e, m) =_{df} (Nat, 0, max)$.

• "Costate" comonad:

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 善臣 - のへぐ

• This comonad arises from the adjunction $S \times - \dashv S \Rightarrow -.$

Symmetric monoidal functors

- A strong/lax symmetric monoidal functor between symmetric monoidal categories (C, I, ⊗) and (^D, I', ⊗') is
 - a functor on $F : \mathcal{C} \to^{D}$
 - $\bullet\,$ together with an isomorphism/map e : $I' \to FI$
 - and a natural isomorphism/transformation with components $m_{A,B} : FA \otimes' FB \to F(A \otimes B)$ satisfying

 A symmetric monoidal natural transformation between two (strong or lax) symmetric monoidal functors (F, e, m), (G, e', m') is a natural transformation τ : F → G satisfying

$$\begin{array}{cccc} I' \stackrel{\mathsf{e}}{\longrightarrow} FI & FA \otimes' FB \stackrel{\mathsf{m}_{A,B}}{\longrightarrow} F(A \otimes B) \\ \left\| \begin{array}{c} & & \\ & & \\ \\ I' \stackrel{\tau_{I}}{\longrightarrow} GI & GA \otimes' GB \stackrel{\mathsf{m}_{A,B}}{\longrightarrow} G(A \otimes B) \end{array} \right\| \end{array}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Symmetric monoidal comonads

A strong/lax symmetric monoidal comonad on a symmetric monoidal category (C, I, ⊗) is a comonad (D, ε, δ) where D is a strong/lax symmetric monoidal functor (with I, ⊗ preserved by e, m) and ε, δ are symmetric monoidal natural transformations, i.e., satisfy

- (Note that Id is always symmetric monoidal and *F*, *G* being symmetric monoidal imply that *GF* is symmetric monoidal too.)
- A strong/lax symmetric semimonoidal comonad is as a strong/lax symmetric monoidal comonad, but without e (on a category which may be without *I*).

Dataflow computations

Dataflow computation = discrete-time signal transformations = stream functions.

The output value at a time instant (stream position) is determined by the input value at the same instant (position) plus further input values.

Example dataflow programs								
pos = 0 fby (pos + 1) sum x = x + (0 fby (sum x)) fact = 1 fby (fact * (pos + 1)) fibo = 0 fby (fibo + (1 fby fibo))								
pos	0	1	2	3	4	5	6	
sum pos	0	1	3	6	10	15	21	
fact	1	1	2	6	24	120	720	
fibo	0	1	1	2	3	5	8	•••

We want to consider functions Str $A \rightarrow$ Str B as impure functions from A to B.

Streams are naturally isomorphic to functions from natural numbers: $Str A =_{df} \nu X.A \times X \cong Nat \Rightarrow A.$

General stream functions $StrA \rightarrow StrB$ are thus in natural bijection with maps $StrA \times Nat \rightarrow B$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Comonad for general stream functions

• Functor:

$$\mathit{DA} =_{\mathrm{df}} (\mathsf{Nat} \Rightarrow \mathit{A}) imes \mathsf{Nat} \cong \mathsf{List} \mathit{A} imes \mathsf{Str} \mathit{A}$$

• Input streams with past/present/future:

$$a_0, a_1, \ldots, a_{n-1}, a_n, a_{n+1}, a_{n+2}, \ldots$$

• Counit:

$$arepsilon_{\mathcal{A}} \hspace{0.1 in}:\hspace{0.1 in} (\operatorname{\mathsf{Nat}} \Rightarrow \mathcal{A}) imes \operatorname{\mathsf{Nat}} \hspace{0.1 in}
ightarrow \hspace{0.1 in} \mathcal{A} \ (a,n) \hspace{0.1 in} \mapsto \hspace{0.1 in} a(n)$$

CoKleisli extension:

$$\begin{array}{rcl} k & : & (\operatorname{Nat} \Rightarrow A) \times \operatorname{Nat} & \to & B \\ \hline k^{\star} & : & (\operatorname{Nat} \Rightarrow A) \times \operatorname{Nat} & \to & (\operatorname{Nat} \Rightarrow B) \times \operatorname{Nat} \\ & & (a, n) & \mapsto & (\lambda m \, k(a, m), n) \end{array}$$

Comonad for causal stream functions

- Functor: $DA =_{df} NEList \cong ListA \times A$
- Input streams with past and present but no future
- Counit:

$$\varepsilon_A$$
 : NEList $A \rightarrow A$
 $[a_0, \dots, a_n] \mapsto a_n$

CoKleisli extension:

$$\begin{array}{c|cccc} k & : & \mathsf{NEList}A & \to & B \\ \hline k^{\star} & : & \mathsf{NEList}A & \to & \mathsf{NEList}B \\ & & & & [a_0, \dots, a_n] & \mapsto & [k[a_0], k[a_0, a_1], \dots, k[a_0, \dots, a_n]] \end{array}$$

Comonad for anticausal stream functions

- Input streams with present and future but no past
- Functor: $DA =_{df} Str A \cong A \times Str A$

Relabelling tree transformations

- Let H : C → C. Define TreeA =_{df} μX.A × HX. We are interested in relabelling functions TreeA → TreeB. (Alt. we can define Tree[∞]A =_{df} νX.A × HX and interest ourselves in relabelling functions Tree[∞]A → Tree[∞]B.)
- Comonad for general relabelling functions:

$$\mathit{DA} =_{ ext{df}} \mathsf{Tree}' \mathit{A} imes \mathit{A} \cong \mathsf{Path} \mathit{A} imes \mathsf{Tree} \mathit{A}$$

where $PathA =_{df} \mu X.1 + A \times H'(TreeA) \times X$ (Huet's zipper).

- E.g., for $HX =_{df} 1 + X \times X$, $H'X \cong 2 \times X$ and Path $A \cong \mu X.1 + A \times 2 \times \text{Tree}A \times X$.
- Comonad for bottom-up relabelling functions:

$$DA =_{df} TreeA$$

Cartesian preclosed structure of the coKleisli category of a strong/lax (semi)monoidal comonad

- Let D be a comonad on a Cartesian closed category C.
- Since $J : C \to \mathbf{CoKI}(D)$ is a right adjoint and preserves limits, $\mathbf{CoKI}(D)$ inherits products from C. Explicitly, we can define

$$\begin{array}{rcl} A \times^{D} B & =_{\mathrm{df}} & A \times B \\ \pi_{0}^{D} & =_{\mathrm{df}} & \mathrm{fst} \circ \varepsilon \\ \pi_{1}^{D} & =_{\mathrm{df}} & \mathrm{snd} \circ \varepsilon \\ \langle k_{0}, k_{1} \rangle^{D} & =_{\mathrm{df}} & \langle k_{0}, k_{1} \rangle \end{array}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

• If D is $(1, \times)$ strong/lax symmetric semimonoidal, then we can also define

$$\begin{array}{rcl} A \Rightarrow^{D} B & =_{\mathrm{df}} & DA \Rightarrow B \\ \mathrm{ev}^{D} & =_{\mathrm{df}} & \mathrm{ev} \circ \langle \varepsilon \circ D\mathsf{fst}, D\mathsf{snd} \rangle \\ \Lambda^{D}(k) & =_{\mathrm{df}} & \Lambda(k \circ \mathsf{m}) \end{array}$$

$$D((DA \Rightarrow B) \times A) \xrightarrow{\langle \varepsilon \circ Dfst, Dsnd \rangle} (DA \Rightarrow B) \times DA \xrightarrow{ev} B$$

$$DC \times DA \xrightarrow{\mathsf{m}} D(C \times A) \xrightarrow{k} B$$

$$DC \xrightarrow{\Lambda(k \circ m)} DA \Rightarrow B$$

◆□ ▶ ◆ ■ ▶ ◆ ■ ▶ ◆ ■ ◆ ● ● ●

• Using a strength (if available) is not a good idea: We have no multiplication

$$DC \times DA \xrightarrow{sl} D(C \times DA) \xrightarrow{Dsr} DD(C \times A) \xrightarrow{?} D(C \times A)$$

and applying ε or $D\varepsilon$ gives a solution where the order of arguments of a function is important and coeffects do not combine:

$$DC \times DA \xrightarrow{\operatorname{id} \times \varepsilon} DC \times A \xrightarrow{\operatorname{sl}} D(C \times A)$$

or

$$DC \times DA \xrightarrow{\varepsilon \times \mathrm{id}} C \times DA \xrightarrow{\mathrm{sr}} D(C \times A)$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

If D is strong semimonoidal (in which case it is automatically strong symmetric semimonoidal as well), then A ⇒^D - is right adjoint to - ×^D A and hence ⇒^D is an exponent functor:

$$\frac{D(C \times A) \to B}{DC \times DA \to B}$$
$$DC \to DA \Rightarrow B$$

• This is the case, e.g., if $DA \cong \nu X.A \times (E \Rightarrow X)$ for some E (e.g., $DA \cong StrA \cong \nu X.A \times (1 \Rightarrow X)$).

- More typically, *D* is only <u>lax</u> symmetric semimonoidal.
- Then it suffices to have m satisfying

$$DA = DA \qquad DA$$

$$\Delta_{DA} \downarrow \qquad \qquad \downarrow D\Delta_{A}$$

$$DA \times DA \xrightarrow{m_{A,A}} D(A, A)$$

where $\Delta = \langle id, id \rangle : A \to A \times A$ is part of the comonoid structure on the objects of C, to get that $m \circ \langle Dfst, Dsnd \rangle = id$ and that \Rightarrow^{D} is a <u>weak</u> exponent operation on objects. It is not functorial (not even in each argument separately).

・ロト ・ 日 ・ モ ト ・ モ ・ うへぐ

Partial uniform parameterized fixpoint operator

Let $F : \mathcal{C} \to \mathcal{C}$. Define $DA =_{df} \nu Z.A \times FZ$.

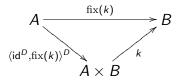

Call a coKleisli map $k : A \times B \rightarrow^{D} B$ guarded if for some k' we have

$$D(A \times B) \xrightarrow{k} B$$

$$\downarrow^{\cong} \qquad \uparrow^{k'}$$

$$(A \times B) \times FD(A \times B) \xrightarrow{\text{fst} \times \text{id}} A \times FD(A \times B)$$

For any guarded $k : A \times B \rightarrow^{D} B$, there is a unique map $fix(k) : A \rightarrow^{D} B$ satisfying

fix is a partial *Conway operator* defined on guarded maps, i.e., besides the *fixpoint property*, for any guarded $k : A \times^D B \longrightarrow^D B$,

$$\operatorname{fix}(k) = k \circ^D \langle \operatorname{id}^D, \operatorname{fix}(k) \rangle^D$$

it satisfies *naturality* in A, *dinaturality* in B, and the *diagonal* property: for any guarded $k : A \times^D B \times^D B \to^D B$,

$$\operatorname{fix}(k \circ^{D} (\operatorname{id}^{D} \times^{D} \Delta^{D})) = \operatorname{fix}(\operatorname{fix}(k))$$

Wrt. pure maps, fix is also *uniform* (i.e., strongly dinatural in *B* instead of dinatural), i.e., for any guarded $k : A \times^{D} B \rightarrow^{D} B$, $\ell : A \times^{D} B' \rightarrow^{D} B'$ and $h : B \rightarrow B'$

 $Jh \circ^D k = \ell \circ^D (\mathrm{id}^D \times^D Jh) \implies Jh \circ^D \mathrm{fix}(k) = \mathrm{fix}(\ell)$

Comonadic semantics

 As in the case of monadic semantics, we interpret the lambda-calculus into CoKI(D) in the standard way (using its Cartesian preclosed structure), getting

$$\begin{bmatrix} [K] \end{bmatrix}^{D} =_{df} \text{ an object of } \mathbf{CoKI}(D) \\ = \text{ that object of } \mathcal{C} \\ \begin{bmatrix} [A \times B] \end{bmatrix}^{D} =_{df} \begin{bmatrix} [A] \end{bmatrix}^{D} \times^{D} \begin{bmatrix} [B] \end{bmatrix}^{D} \\ = \llbracket A \rrbracket^{D} \times \llbracket B \rrbracket^{D} \\ \begin{bmatrix} [A] \end{bmatrix}^{D} \Rightarrow^{D} \llbracket B \rrbracket^{D} \\ = D\llbracket A \rrbracket^{D} \Rightarrow \llbracket B \rrbracket^{D} \\ \begin{bmatrix} \underline{C} \rrbracket^{D} =_{df} \llbracket C_{0} \rrbracket^{D} \times \ldots \times \llbracket C_{n-1} \rrbracket^{D} \\ = \llbracket C_{0} \rrbracket \times \ldots \times \llbracket C_{n-1} \rrbracket^{D} \end{bmatrix}$$

$$\begin{split} \llbracket (\underline{x}) \, x_i \rrbracket^D &=_{\mathrm{df}} & \pi_i^D \\ &= \pi_i \circ \varepsilon \\ \llbracket (\underline{x}) \, fst(t) \rrbracket^D &=_{\mathrm{df}} & \pi_0^D \circ^D \llbracket (\underline{x}) \, t \rrbracket^D \\ &= fst \circ \llbracket (\underline{x}) \, t \rrbracket^D \\ \llbracket (\underline{x}) \, snd(t) \rrbracket^D &=_{\mathrm{df}} & \pi_1^D \circ^D \llbracket (\underline{x}) \, t \rrbracket^D \\ &= snd \circ \llbracket (\underline{x}) \, t \rrbracket^D \\ \llbracket (\underline{x}) \, (t_0, t_1) \rrbracket^D &=_{\mathrm{df}} & \langle \llbracket (\underline{x}) \, t_0 \rrbracket^D, \llbracket (\underline{x}) \, t_1 \rrbracket^D \rangle^D \\ &= \langle \llbracket (\underline{x}) \, t_0 \rrbracket^D, \llbracket (\underline{x}) \, t_1 \rrbracket^D \rangle^D \\ \llbracket (\underline{x}) \, \lambda xt \rrbracket^D &=_{\mathrm{df}} & \Lambda^D (\llbracket (\underline{x}, x) \, t \rrbracket^D) \\ \llbracket (\underline{x}) \, t \, u \rrbracket^D &=_{\mathrm{df}} & ev^D \circ^D \langle \llbracket (\underline{x}) \, t \rrbracket^D, \llbracket (\underline{x}) \, u \rrbracket^D \rangle^D \\ &= ev \circ \langle \llbracket (\underline{x}) \, t \, \rrbracket^D, (\llbracket (\underline{x}) \, u \rrbracket^D)^\dagger \rangle \end{split}$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ ▲□ ● ● ●

- Coeffect-specific constructs are interpreted specifically.
- E.g., for the constructs of a general/causal/anticausal dataflow language we can use the appropriate comonad and define:

$$\begin{split} \llbracket(\underline{x}) \ t \ fby \ u \rrbracket^D &=_{\mathrm{df}} \quad \mathrm{fby} \ \circ \langle \llbracket(\underline{x}) \ t \rrbracket^D, (\llbracket(\underline{x}) \ u) \rrbracket^D)^{\dagger} \rangle^D \\ \llbracket(\underline{x}) \ t \ next \ u \rrbracket^D &=_{\mathrm{df}} \quad \mathrm{next} \ \circ (\llbracket(\underline{x}) \ t \rrbracket^D)^{\dagger} \end{split}$$

・ロト・日本・モート モー うへぐ

- Again, we have soundness of typing, in the form $\underline{x} : \underline{C} \vdash t : A$ implies $[\![(\underline{x})t]\!]^D : [\![\underline{C}]\!]^D \rightarrow^D [\![A]\!]^D$, but not all equations of the lambda-calculus are validated.
- For a closed term ⊢ t : A, soundness of typing says that
 [[t]]^D : 1 →^D [[A]]^D, i.e., D1 → [[A]]^D, so closed terms are
 evaluated relative to a coeffect over 1.
- In case of general or causal stream functions, an element of *D*1 is a list over 1, i.e., a natural number, the time elapsed.
- If D is strong or lax symmetric monoidal (not just semimonoidal), we have a canonical choice e : 1 → D1.

• Comonadic dataflow language semantics: The first-order language agrees perfectly with Lucid and Lustre by its semantics.

The meaning of higher-order dataflow computation has been unclear. We get a neat semantics from mathematical considerations (cf. Colaço, Pouzet's design with two flavors of function spaces).

Symmetric monoidal comonads (and strong monads) in linear / modal logic

- Strong symmetric monoidal comonads are central in the semantics of intuitionistic linear logic and modal logic to interpret the ! and □ (◊) operators.
- Linear logic: Benton, Bierman, de Paiva, Hyland; Bierman; Benton; Mellies; Maneggia; etc.
- Modal logic: Bierman, de Paiva.
- Applications to staged computation and semantics of names: Pfenning, Davies, Nanevski.
